

## AMENDMENTS TO THE CLAIMS

1. *(Currently amended)* A blank panel comprised of a mating structure and at least two face plates separably combined along a break-off groove extending between two opposing side surfaces of said blank panel, wherein at least one of said at least two face plates has two contact faces on opposing ends adjacent said side surfaces separated by reinforcement ribs, and wherein at least one of said at least two face plates has two finite T-shaped channels inwardly extending from both of said opposing side surfaces along said contact faces for exchangeably and slidably holding said correspondingly shaped mating structure[.], wherein said mating structure is part of a fastener having at least two laterally resilient protrusions extending substantially symmetrically with respect to an attachment axis of said fastener, said attachment axis being substantially perpendicular with respect to said contact face while said mating structure is held in said channel, and wherein said at least two laterally resilient protrusions feature straddle legs extending away from said mating structure in a straddle angle (654) such that said at least two laterally resilient protrusions induce a pulling force via said straddle legs and said mating structure on said face plate, while said laterally resilient protrusions are inserted in an orifice hole (4).
  
2. *(Previously Presented)* The blank panel of claim 1, wherein at least one of said contact faces further comprises positioning indicators for indicating a predetermined position of said mating structure, the positioning indicators being arranged parallel to a plane of the at least one of said contact faces.

3. *(Previously Presented)* The blank panel of claim 1, wherein said break-off groove includes a bridge structurally exclusively connecting two adjacent face plates, where the bridge has a thickness that is less than that of said at least two face plates.
4. *(Previously Presented)* The blank panel of claim 3, wherein said break-off groove further comprises levering faces for inducing a tension force onto said bridge at and in excess of a break-off bending angle between said two adjacent face plates, where said levering faces are angled and oppositely positioned of said bridge.

5-9 *(Cancelled)*
